

Endpoint Choice Changes the Method Ranking

The method story changes when the endpoint changes.

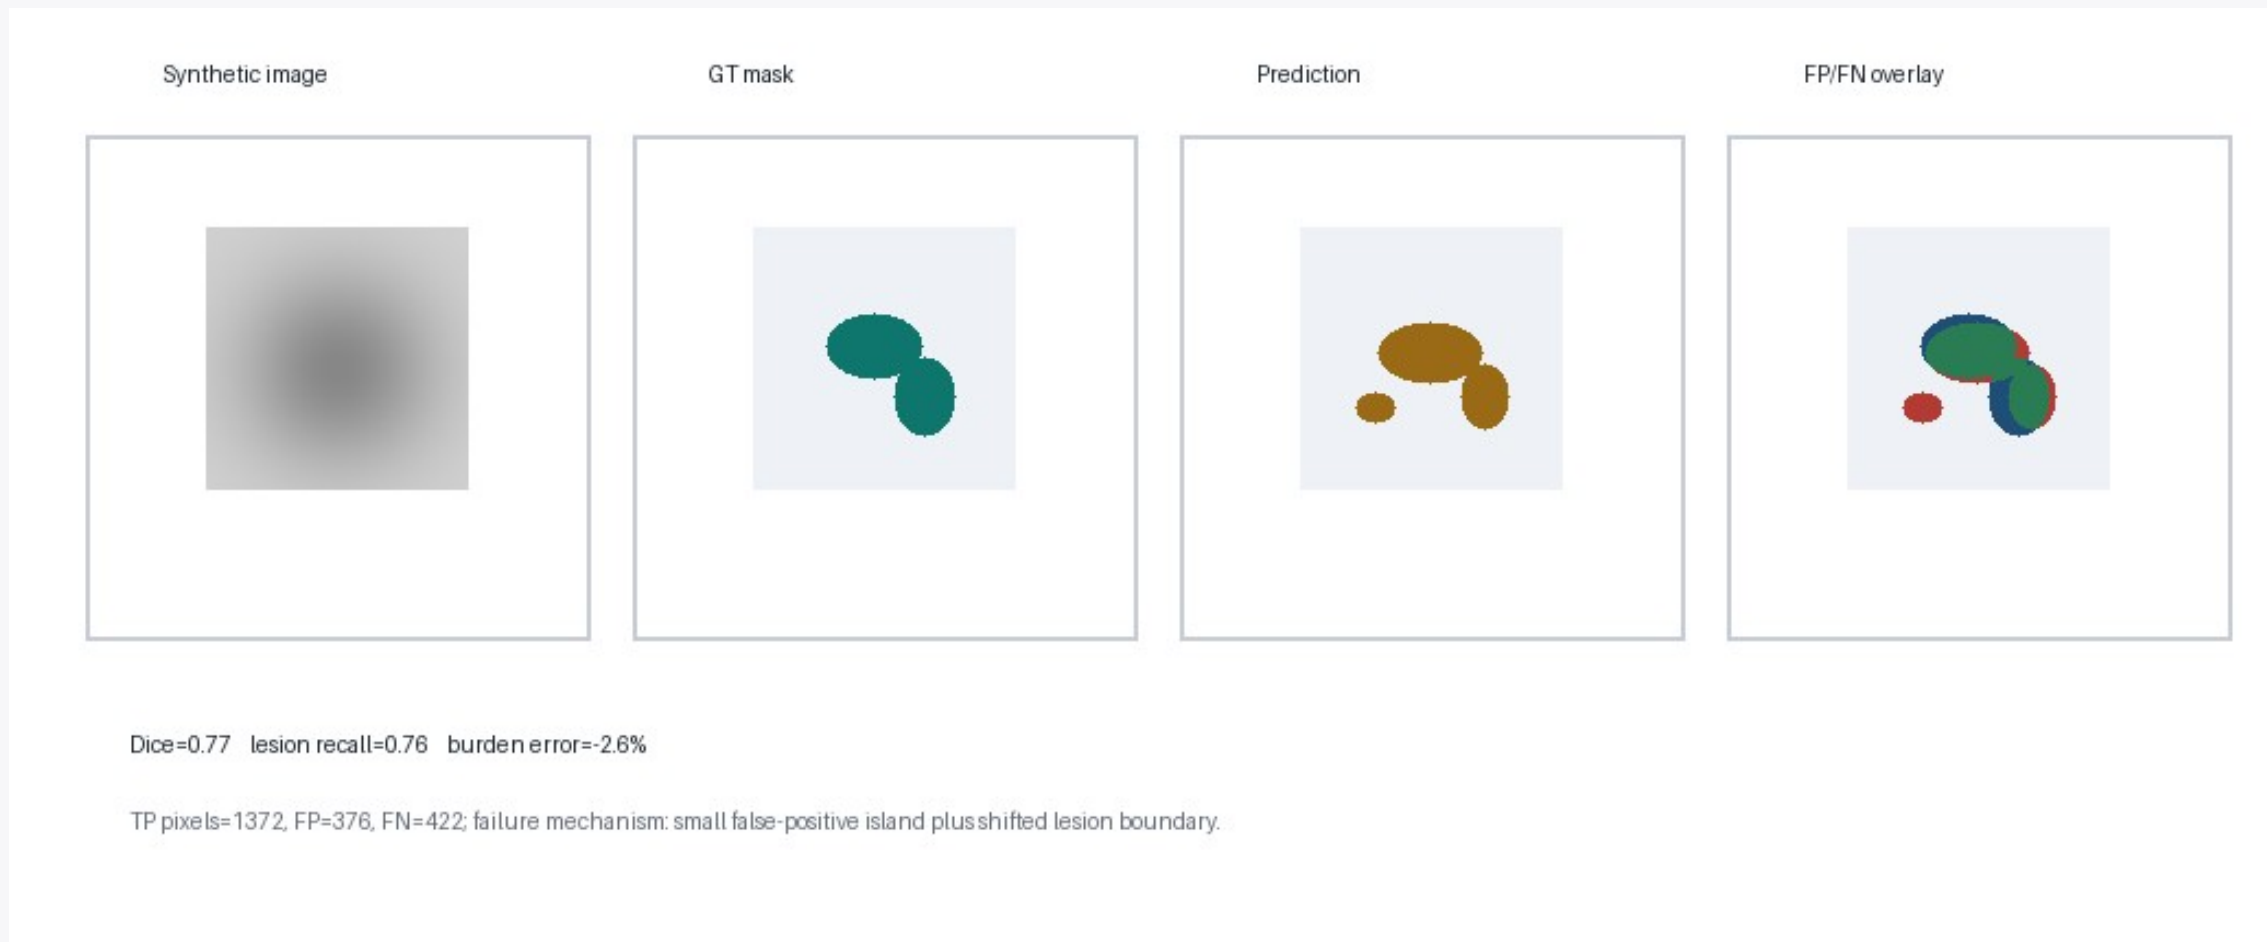

Interpretation
Calibrated wins recall and burden error;
Baseline wins Dice only.

Meeting decision
Freeze endpoint priority before ranking methods.

Average Dice Can Hide the Hard Case

02/04

A case page binds image, GT, prediction, error overlay, and metric.

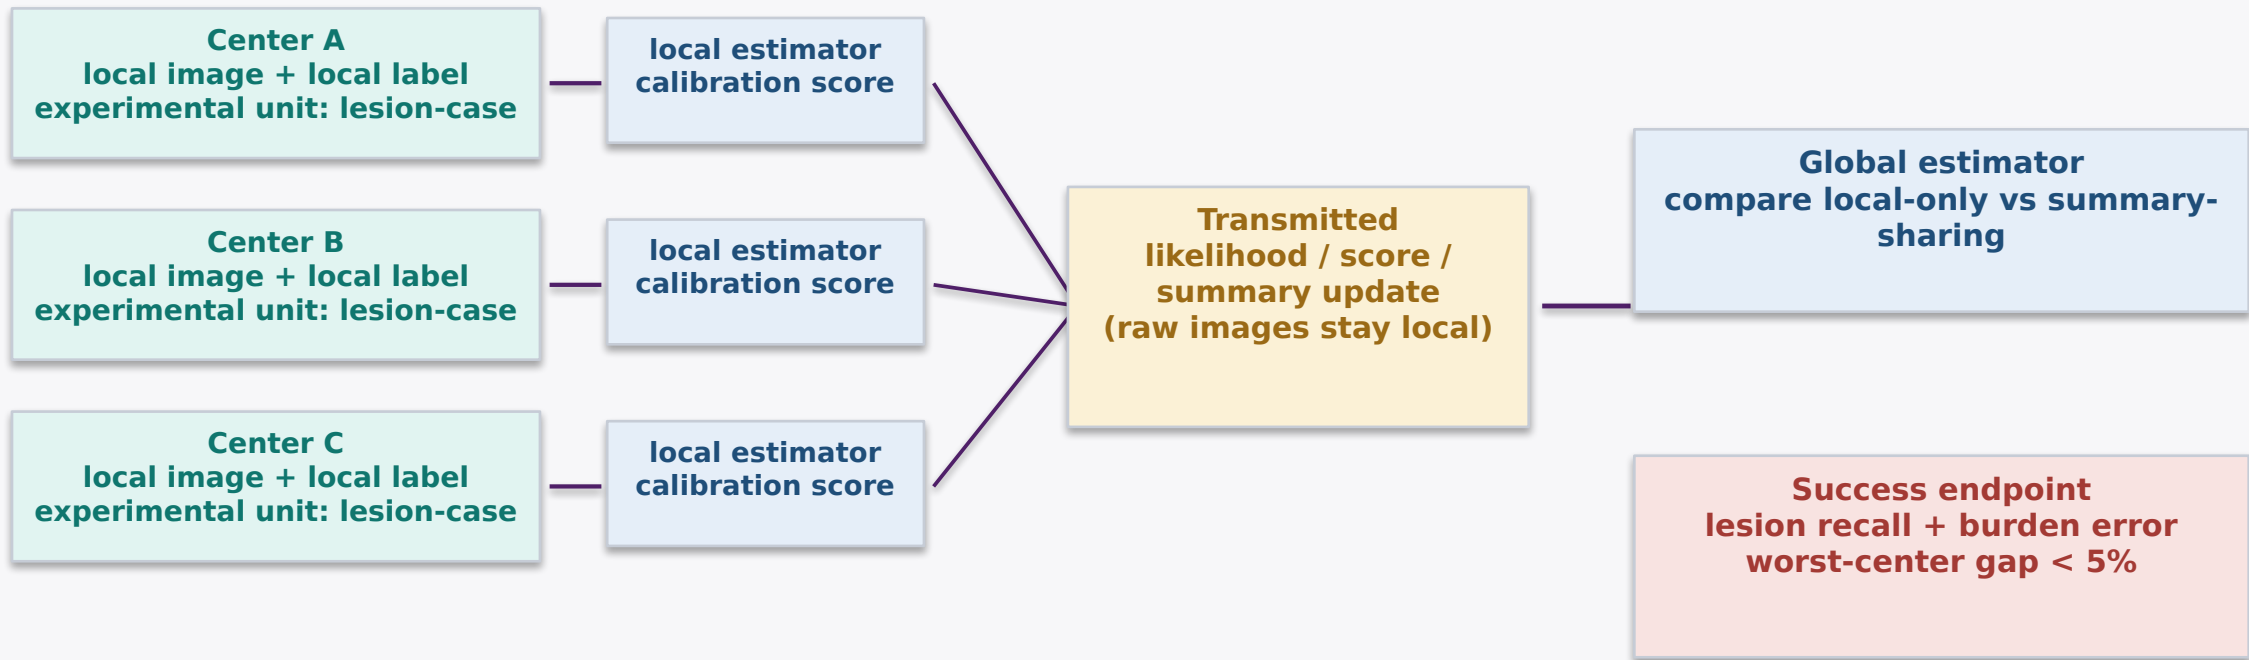

Scientific object: same synthetic case, aligned GT/prediction/error overlay, case metric next to visual.

Reference retrieval: failure-case query selected inspected pages RRL-022, RRL-024, RRL-018, RRL-013, RRL-025; trace in EVIDENCE_MANIFEST; style not copied.

Limited-Information Multi-Center Experiment

Raw data stay local; shared summaries are judged by endpoint-level evidence.

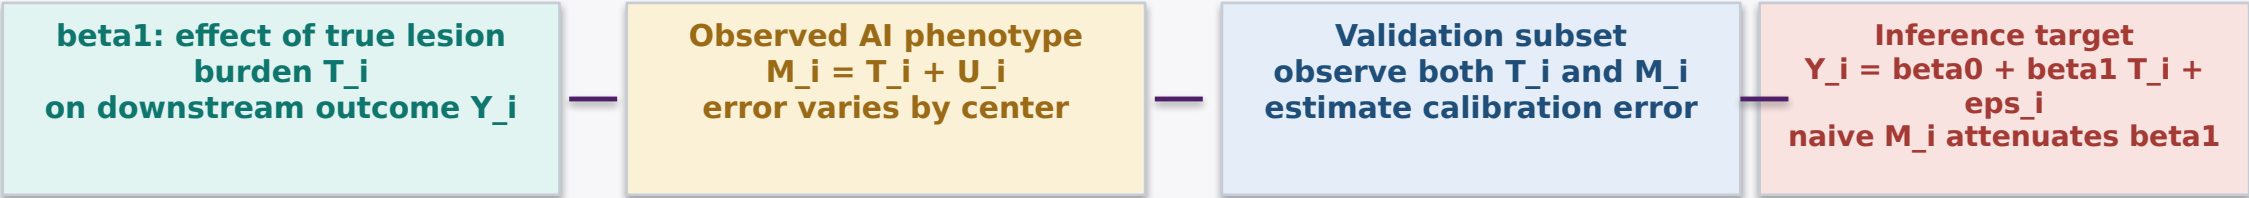

Comparator: local-only model. What moves: score summaries and likelihood updates. What stays local: images, labels, case identifiers.

AI Phenotype Error Changes Inference

Segmentation output is a measured variable whose error can attenuate inference.

Target estimand

Toy calibration: $E[T|M,\text{center}] = \alpha_{\text{center}} + \gamma_{\text{center}} M$. Report beta1 after validation-calibrated correction, not a raw AI burden coefficient.

Evidence boundary
This page is a generated-variable inference mechanism,
not completed clinical validity evidence.
